HEARING

The following is a simulation. A common children's story has been used to show how missing even a little hearing (25dB HL) can make it more difficult to understand. Most children with well fit hearing aids or cochlear implants hear NO BETTER than this from 6 feet when not watching, and many hear words in an even more fragmented manner. What is the story? How would hearing like this affect learning pace?

***Won upon a time a itty
mow when to vit a untry
mow. The untry mow
live in a feel. EEE wuz lad
to shee hi zittyfren.
A too my ran abowda
feel and lay unt noo.***
